

Evolution 101

Lesson 24

Evolution Denies free Will.

A correct understanding of our origins is vital to the general welfare of man and society since a proposition concerning origins is the foundation of all other convictions, actions and beliefs.

If evolution is true, there is no meaning to life, no free will. Everything that happens is nothing more than the chance mingling of dancing atoms. Atoms abide by the laws of nature and do not have the free will to break a law. Therefore, atoms cannot be the cause of freewill. Any semblance of choice employed by the writer or reader of this essay would be no more than an illusion. The con-trolling force for survival would be the “me first” syndrome where might is right.

Without an absolute moral code that transcends mankind and atoms, one person’s code of right and wrong is as valid as the next one. In this scenario, a person’s “me first” syndrome causes him to obey society’s rules because it is convenient, not because it is right to do so based on some objective standard or that God commands it. If it makes no real difference, if there is no God to worry about, there is no natural or scientific reason why a person should reject rape, robbery or murder if his “me first” needs can be met with such behavior.

Without empirical proof that macroevolution actually happened or is even possible, it is no more than a religion. This writer and others have made standing offers of \$10,000 or more for such proof without ever receiving a claim. Science means knowledge. Scientists know nothing for sure about evolution; they just believe it. Others believe in another religion. To dramatize just how unscientific macro-evolution is, the most important broken natural laws will be reviewed.

Law of Cause and Effect

Anything that has a beginning must have a cause. The effect cannot be greater than the cause. A person is a living, feeling and intelligent being and must have been cause by at least a living, feeling and intelligent being. Atoms cannot be the cause of a continuing series of greater and greater effects.

First Law of Thermodynamics

This law states that the matter and energy of the universe are constant. In other words, natural processes of chemistry and physics can neither create nor destroy matter or energy nor explain its own origin or properties such as gravity and electromagnetism, etc.

Second Law of Thermodynamics

This best established law of science declares that all conversions of energy from one form to another will decrease order and complexity in natural systems. This is opposite the unproven claims of macroevolution which teach that atoms increased in order by random, chance processes from particles to people.

Since useful energy is continually decreasing, there comes a time when no more work can be done. The universe will have reached equilibrium where nothing else will happen. The universe will have died. Since this has not yet happened, extrapolating backward, there must have been a beginning. This requires a cause. The First Law dis-qualifies itself; this leaves only a metaphysical cause that transcends natural processes called God by Christians.

The Law of Biogenesis

This law confirms the principle that the effect cannot be greater than the cause. Lifeless chemicals cannot be the cause of living organisms. Science has proved that “life comes only from life” by experiments by Louis Pasteur and

others. The food canning industry confirms the point. When food is completely sterilized before canning, the can of food will last forever. Pasteur's sterile broth in a beaker capped with an open "S" curve, is still sterile, lifeless after over 150 years in storage.

The Law of Probability

The probability of just one specific protein arising by random chance shuffling of an ocean full of amino acids is no better than one in 10^{520} and thousands are needed along with an encyclopedic amount of DNA. Consider that the total atoms in the universe is estimated to be only 10^{80} . Only atheists believe in spontaneous generation in spite of those odds.

The Law of Mass Action

This law teaches that chemical reactions such as amino acids combining to form proteins are reversible. The energy that builds them up will also tear them down (just as the Second Law describes).

The Law of Inertia

This law declares that an object at rest or in motion will remain at rest or in motion unless acted upon by an outside force. What was the outside force that caused the so-called Big Bang explosion and give us something out of nothing?

Law of Angular Momentum

This law declares that radial motion as produced by an exploding bomb or the so-called Big Bang cannot change into orbital or circular motion or condense into lumps in space without an outside force. What was the outside force that gave us condensing, spinning planets and revolving galaxies?

The Fossil Record

The fossils are supposedly the historical record of evolution. But nowhere does the fossils in the sedimentary layers of the earth's crust show an undisputed transition of one kind of organism evolving into a more complex one. There should be literally millions of them if macroevolution were true.

Evolution Requires Billions of Years

There is no proof that billions of years of earth history ever existed. W.B. Provine, atheistic evolutionist, admits: *"Most of what I learned of the field in graduate (1964-68) school is either wrong or significantly changed."*

In reality, all age-dating methods, including those which point to a young earth, rely on unprovable assumptions. For instance, how is Time 0 determined in radiometric systems? About 90% of all of the familiar earth dating systems give ages far too young even to think of providing time for evolution to take place.

Sir Isaac Newton, creationist, and considered the greatest scientist of all time wrote: *"This most beautiful system of sun, planets, and comets could only proceed from the council and dominion of an intelligent and powerful being."*
